A static reservoir model, built using seismic and well data (Cannon, 2018), constitutes a non-changeable rock property such as lithology, porosity and permeability (Pyrcz and Deutsch, 2014), and does not express the fluid flow behaviour (Perrin and Rainaud, 2013).

CGG: Dynamic Reservoir Modelling

In general, the static model of a reservoir is the final integrated product of the structural, stratigraphic and lithological modeling activities, where

each of these steps is developed according to its specific workflow. A static reservoir study typically proceeds through four main stages. 1.

Integrated Reservoir Modeling - Oil&Gas Portal

A model of a specific volume of the subsurface that incorporates all the geologic characteristics of the reservoir. Such models are used to quantify characteristics within the subsurface volume that are relatively stable over long periods of time and can, therefore, be considered static. These attributes include the structural shape and thicknesses of the formations within the subsurface volume being modeled, their lithologies, and the porosity and permeability distributions.

Integrated Reservoir Modeling - Oil&Gas Portal

The goal of reservoir modeling is to create a holistic representation, over a region of interest, of the different attributes within a given reservoir. This can include data, at a required resolution, such as facies, porosity and permeability. To do this with accuracy and uncertainty is impossible.

Introduction to Reservoir Simulation - SPE Aberdeen

In numerical simulation and modeling, the numerical reservoir model is developed using available static and dynamic data. This flow model is based on the geological model. Considering the fact that the geo- cellular model is built using the geological and geophysical data, and then the upscaling process is

performed, and the flow model is developed using the well-known
