Strong absorption of femtosecond laser pulses in Au nano-colloidal suspensions was used to generate coherent ultrasound signals at 1-20 MHz frequency range. The most efficient ultrasound generation was observed at negative chirp values and was proportional to the pulse duration. Maximization of a dimensionless factor $A \equiv \frac{1}{\tau_p} \tau_p$ defined as the ratio of

4.2.1. Chirp Impulses. We use linear chirp signals to transmit the sound signal. A linear chirp is a signal in which the frequency increases or decreases linearly with time (up- and down-chirps). Some of their characteristics make them applicable for localization. Signals with maximum energy are essential for receiving short signals over large ...

Chirp signals are an ingenious way of handling a practical problem in echo location systems, such as radar and sonar. Figure 11-9 shows the frequency response of the chirp system. The magnitude has a constant value of one, while the phase is a parabola:

The fractional Fourier transform (FrFT) presents best localization performance in a certain FrFT domain, which is useful

for the detection and estimation of multicomponent linear frequency modulation (LFM) signals and some improved algorithms based on FrFT are also proposed, such as EEMD-FrFT and STFT ; they overcome some disadvantages such as high computation cost for combined chirp signals. In this paper, a method called mixing change rate-FrFT (MCR-FrFT) is proposed to deal with the drawback.

A theory of frames that extend Gabor analysis by including chirping is discussed. The chirping parameter in these 'time-frequency localization frames' depends on time and/or frequency shift parameters that can be

adapted to analyze and detect chirps in noisy signals. Radar/sonar applications are outlined.

This paper introduces the Energy Optimized Distributed Localization (EODL) method as a range-free localization protocol which is not affected by the sound velocity. In such a technique, the sensor nodes calculate their unknown positions by the geometric intersection of the beacon signals sent by the AUV.

A chirp is a signal in which the frequency increases (up-chirp) or decreases (down-

chirp) with time. In some sources, the term chirp is used interchangeably with sweep signal. It is commonly applied to sonar, radar, and laser systems, and to other applications, such as in spread-spectrum communications.. In spread-spectrum usage, surface acoustic wave (SAW) devices are often used to generate ...

it provides tighter timing resolution and better Signal-to-Noise (SNR) ratios given
