In this Letter, we point out that the photon helicity in $b \rightarrow s \gamma$ can be unambiguously extracted by combining the measurements in $B \rightarrow K^* \gamma$ and the Cabibbo-favored $D \rightarrow K^* e^+ \nu$ decay. We propose a ratio of up-down asymmetries in $D \rightarrow K^* e^+ \nu$ to quantify the hadronic effects. A method for measuring, in experiment, the involved partial decay widths in the ratio is discussed, and experimental facilities like BESIII, Belle-II and LHCb are likely to measure this ratio.

We discuss the use of helicity methods in evaluating loop diagrams by analyzing a specific example: the one-loop contribution to $e^+ e^- \rightarrow q \bar{q} g$ in massless QCD. By using covariant helicity representations for the spinor and vector wave functions we obtain the helicity amplitudes directly from the Feynman loop diagrams by covariant contraction.

Novel method to reliably determine the photon helicity in $\epsilon \rightarrow \gamma$

The great simplicity attained by the Weyl-van der Waerden spinor technique in the evaluation of helicity invariant amplitudes is shown to apply in the cumbersome calculations within the framework of linearized gravitation. Once the graviton couplings to spin-0, 1/2, 1, and 3/2 particles are given, we exhibit the reach of this method by evaluating, as an example, the helicity amplitudes for the ...
