Boundary Value Problems of Heat Conduction - Knovel

The main purpose of this chapter is to

study boundary value problems for the heat equation on a finite rod $a < x < b$. $u_t(x,t) = ku_{xx}(x,t)$; $a < x < b$; $t > 0$ $u(x,0) = f(x)$ The main new ingredient is that physical constraints called boundary conditions must be imposed at the ends of the rod. The two main conditions are $u(a,t) = 0$; $u(b,t) = 0$ Dirichlet Conditions $u_x(a,t) = 0$; $u_x(b,t) = 0$ Neumann Conditions $u(a,t) = f(t)$; $u(b,t) = g(t)$ Robin Conditions

Problems involving the wave equation, such as the determination of normal modes, are often stated as boundary value problems. A large class of

important boundary value problems are the Sturm–Liouville problems. The analysis of these problems involves the eigenfunctions of a differential operator. To be useful in applications, a boundary value problem should be well posed. This means that given the input to the problem there exists a unique solution, which depends continuously on the input.

Applying the boundary conditions gives, $0 = y(0) = c_1 \cdot 0 = y(2\pi) = c_2 \sin(2\sqrt{3}\pi) \Rightarrow c_2 = 0$ $0 = y(0) = c_1 \cdot 0 = y(2\pi) = c_2 \sin(2\sqrt{3}\pi) \Rightarrow c_2 = 0$. In this case we found both constants to be zero and so the solution is, $y(x) = 0$ $y(x) = 0$. In the previous example the solution was $y(x) = 0$ $y(x) = 0$.

Differential Equations - Boundary Value Problems

Boundary-value problems of diffusional heat-transfer processes are usually formulated on the basis of the first law of thermodynamics. To obtain the same result when the method of irreversible thermodynamics is applied an additional assumption that the temperature gradient values over the whole domain are reasonably small must be introduced.
