Symmetry and Spectroscopy of Molecules by K. Veera Reddy

Molecular symmetry in chemistry describes the symmetry present in molecules and the classification of molecules according to their symmetry.

Molecular symmetry is a fundamental concept in chemistry, as it can be used to predict or explain many of a molecule's chemical properties, such as its dipole moment and its allowed spectroscopic transitions. To do this it is necessary to classify the states of the molecule using the irreducible representations from the character table of the symmetry group

Symmetry and Spectroscopy - Molecular Vibrations
7.1 Bases for molecular vibrations We investigate a molecule consisting of N atoms, which has $3N$ degrees of freedom. Taking the translations (3) and rotations (3 for non-linear, 2 for linear molecules) into account, we obtain $3N-6$ (5) vibrational degrees of freedom for the non-linear (linear) case.

Symmetry is an

important factor in spectroscopy. Nature says: atoms that are symmetry-inequivalent can absorb at different shifts. atoms that are symmetry-equivalent must absorb at the same shift. To learn about symmetry, take a model of pentane and do the following: make sure the model is twisted into the most symmetric shape possible: a nice "W".

All $3N$ degrees of freedom have symmetry relationships consistent with the irreducible representations of the molecule's point group. A linear molecule is characterized as possessing a bond angle of 180° with either a $C_\infty v$ or $D_\infty h$

symmetry point group. Each point group has a character table that represents all of the possible symmetry of that molecule. Specifically for linear molecules, the two character tables are shown below:
