average speed: distance traveled divided by time during which motion occurs  
average velocity: displacement divided by time over which displacement occurs  
instantaneous velocity: velocity at a specific instant, or the average velocity over an infinitesimal time interval  
instantaneous speed: magnitude of the instantaneous velocity time:

**Time, Velocity, and Speed | Physics - Lumen Learning**

So average speed can be greater than average velocity, which is displacement divided by time. For example, if you drive to a store and return home in half an hour, and your car's odometer shows the total distance traveled was 6 km,

then your average speed was 12 km/h. Your average velocity, however, was zero, because your displacement for the round trip is zero.

**2.3: Time, Velocity, and Speed - Physics LibreTexts**

Example: You walk from home to the shop in 100 seconds, what is your speed and what is your velocity? Speed =  $220 \text{ m} / 100 \text{ s} = 2.2 \text{ m/s}$ . Velocity =  $130 \text{ m} / 100 \text{ s} \text{ East} = 1.3 \text{ m/s East}$ . You forgot your money so you turn around and go back home in 120 more seconds: what is your round-trip speed and velocity? The total time is  $100 \text{ s} + 120 \text{ s} = 220 \text{ s}$ :

### **VELOCITY TIME & DISTANCE CALCULATOR**

You know your total distance and the time taken, so plug into the formula for speed:  $\text{speed} = \frac{\text{distance}}{\text{time}}$

speed = distance / time  
 $\text{speed} = \frac{\text{distance}}{\text{time}}$   
 $\{40\} \{1\} = 40\text{mph}$   
 $\text{speed} = 140 = 40\text{mph}$

### How to Find a Distance From Velocity & Time | Sciencing

To solve for distance use the formula for distance  $d = st$ , or distance equals speed times time.  $\text{distance} = \text{speed} \times \text{time}$   
 Rate and speed are similar since they both represent some distance per unit time like miles per hour or kilometers per hour. If rate  $r$  is the same as speed  $s$ ,  $r = s = d/t$ .

### Velocity - speed, distance and time - math lesson - YouTube

In a physics equation, given a constant acceleration and the change in velocity of an object, you can figure out both the time involved and the distance traveled. For instance, imagine you're a drag racer. Your acceleration is 26.6 meters per second<sup>2</sup>, and your final speed is 146.3 meters per second. Now find the total distance traveled.

### **Speed Distance Time | Test**

Velocity equals distance traveled divided by time of travel (the speed) plus the direction of travel. For example, the velocity of a train traveling 1,500 kilometers eastward from San Francisco in 12 hours would be 1,500 km divided by 12 hr east, or 125 kph east.

### **Equations for Speed, Velocity & Acceleration | Sciencing**

Speed = Distance/time =  $15/2 = 7.5$  miles per hour. Example 3. A car takes 4 hours to cover a distance, if it travels at a speed of 40 mph. What should be its

speed to cover the same distance in 1.5 hours?

### **Distance, Displacement, Speed and Velocity - YouTube**

The formula for distance, if you know time (duration) and the average speed, is:  $d = v \times t$  where  $v$  is the velocity (average speed),  $t$  is the time and  $d$  is distance, so you can read it as Distance = Speed x Time.
