As one of the methods of structural analysis, the direct stiffness method, also known as the matrix stiffness method, is particularly suited for computer-automated analysis of complex structures including the statically indeterminate type. It is a matrix method that makes use of the members' stiffness relations for computing member forces and displacements in structures. The direct stiffness method is the most common implementation of the finite element method. In applying the method, the system

In modern engineering practice, such structures of medium to high complexity are typically analysed using matrix structural analysis. The advantage of matrix structural analysis is that it can easily be programmed to be solved using a computer. The use of this method with a computer allows the analysis of complex structures that would have been impossible previously. Matrix structural analysis usually uses a stiffness-type method for analysis.
