Wave Propagation And Group Velocity

The group velocity of a wave is the velocity with which the overall envelope shape of the wave's amplitudes—known as the modulation or envelope of the wave—propagates through space. For example, if a stone is thrown into the middle of a very still pond, a circular pattern of waves with a quiescent center appears in the water, also known as a capillary wave. The expanding ring of waves is the wave group, within which one can discern individual wavelets of differing wavelengths traveling ...

In the context of GNSS signals, the carrier waves are propagating with the phase velocity and thence, this is the velocity associated to the carrier measurements. The group velocity is what has to be considered for the code measurements, i.e, pseudoranges obtained from the codes modulated in the carriers [footnotes 1].

The envelope (the green line) is given by u_1 and travels at the group velocity. The carrier wave (the blue line) travels at the phase velocity and is given by u_2 . The wave packet moves at the group velocity. It is the envelope which carries information. Group velocity and phase velocity are not necessarily the same. Group velocity is given by,

In deep water, longer period waves propagate faster and transport their energy faster. The deep-water group velocity is half the phase velocity. In shallow water, for wavelengths larger than twenty times the water depth, as found quite often near the coast, the group velocity is equal to the phase velocity. History

Dispersion (water waves) - Wikipedia

Wave velocity is a general concept, of various kinds of wave velocities, for a wave's phase and speed concerning energy (and information) propagation. The phase velocity is given as: v_p , where: v_p is the phase velocity (in meters per

second, m/s); ω is the angular frequency (in radians per second, rad/s); k is the wavenumber (in radians per meter, rad/m).; The phase speed gives you the ...

Group velocity can be interpreted as the speed at which a disturbance in the wave propagates. Information may be conveyed as meaningful disturbances relative to a steady-state condition, so group velocity is also the speed of information in a wave. Note Equation

In other words, the velocity of the particle is equal to the group of the waves with which the wave packet is made of. The velocity of the group or wave packet is called the group velocity. The group velocity can be mathematically expressed as, $v_g = d\omega/dk$. It is the velocity with which the particle moves.

Difference Between Phase Velocity and Group Velocity

In a given medium, the frequency is some function $\omega(k)$ of the wave number, so in general, the phase velocity $v_p =$

ω/k and the group velocity $v_g = d\omega/dk$ depend on the frequency and on the medium. The ratio between the speed of light c and the phase velocity v_p is known as the refractive index, $n = c / v_p = ck / \omega$.

Phase velocity - Wikipedia

However, light consists of a variety of wavelengths with certain phase velocities. The EM wave appears as a superposition of waves with several frequencies and phase velocities, which we introduced as a wave package. The resulting envelope of the wave package propagates at a velocity, which is defined as the group velocity [DEM08].

On the other hand, for impulsive elastic wave packets a group velocity can be defined under certain assumptions as the gradient in phase space of the dispersion relation. As will be shown in the paper, if definable, the group velocity can be alternatively computed by the expression for the energy

velocity.
