### **Turbulence Models And Their Applications**

A turbulence model is a procedure to close the system of mean flow equations. For most engineering applications it is unnecessary to resolve the details of the turbulent fluctuations. Turbulence models allow the calculation of the mean flow without first calculating the full time-dependent flow field.

LES is much more complex than RANS models, and is better suited for high-end applications (combustion, mixing, external aerodynamics like flow around bluff bodies). Large-eddy simulation (LES) models resolve the largest scales of turbulence and model the rest by use of sub-grid turbulence models or by blending with a RANS model. Positives: Buoyancy
