$xn - (xn+1 + xn+2) = xn(1 - x - x^2)$ For a move of type (ii), we obtain a change in value $xn+2 - (xn+1 + xn) = xn(x^2 - x - 1)$. Now it is time to specify the number x . We choose x so that there is no change in value for a jump of type (i). For this we need. $1 - x - x^2 = 0$. Thus $x = (-1 \pm \sqrt{5}) / 2$.

Mathematical Constants II. Famous mathematical constants include the ratio of circular circumference to diameter, $\pi = 3.14 \dots$, and the natural logarithm base, $e = 2.718 \dots$. Students and professionals can often name a few others, but there are many more buried in the literature and awaiting discovery.

Now, we can transform the problem of finding a train into the problem of finding a path thru the graph of the domino set that touches all the edges. The circular train problem becomes that of finding a path thru the graph of the domino set which includes all the edges and returns to the node from which it started.
