Chemistry Ionic And Metallic Bonding

This explains many properties of ionic

solids. They are hard and brittle, they are not malleable or ductile (i.e. cannot be shaped without cracking/breaking), and they do not conduct electricity. Metallic bonding describes a lattice of positively charged ions, surrounded by a mobile 'sea' of valence electrons. In contrast with ionic bonding, the valence orbitals are delocalized over the entire metal lattice, electrons are free to move and are not associated with individual cations.

Chemical bonds are formed when a chemical compound is created through the joining of multiple atoms. Ionic bonds are formed when an electron moves from one atom to another, and covalent bonds are formed when two different atoms share one or more pair of electrons. Metallic bonds are best described as a sea of electrons.
