all mathematicians should learn about complex analysis. First, it is, in my humble opinion, one of the most beautiful areas of mathematics. One way of putting it that has occurred to me is that complex analysis has a very high ratio of theorems to definitions (i.e., a very low “entropy”): you get a lot more as “output” than you put in as “input.” The second reason is complex analysis has a large number of applications

Complex Analysis is concerned with the study of complex number valued functions with complex number as domain. Let  $f: C \rightarrow C$  be such a function. What can we say about it? Where do we use such an analysis? The complex number  $i = \sqrt{-1}$  appears in Fourier Transform, an important tool in analysis and engineering, and in the Schrodinger equation, “ $i\hbar \frac{\partial}{\partial t} = -\frac{\hbar^2}{2m} \nabla^2 + V$ ”

Note that every nonzero complex number has infinitely many different arguments,  $e^{i\theta} = \cos \theta + i \sin \theta = \cos(\theta + 2\pi n) + i \sin(\theta + 2\pi n)$  for any integer  $n$ . We use the notation  $e^{i\theta}$  to refer to  $\cos \theta + i \sin \theta$ . Then  $e^{i\theta}$  is the exponential form of  $z$ , though we may also refer to this as the polar form.

In these lecture notes we take the position that the core of complex analysis is the study of power series  $\sum_{n=0}^{\infty} a_n(z-z_0)^n$  and of the characteristic properties of those functions which can be represented locally as such a power series. As we will see below, one characteristic property of such functions is analyticity. Definition 1.2.1.

It turns out that complex differentiability is a very strong condition and differentiable functions behave very well. Integration is along paths in the complex plane. The central result of this spectacularly beautiful part of mathematics is Cauchy's Theorem guaranteeing that certain integrals along closed paths are zero. This striking result leads to useful techniques for evaluating real integrals based on the 'calculus of residues'.

Every complex number  $z = x + iy$  with  $x, y \in \mathbb{R}$  has a complex conjugate number  $\bar{z} = x - iy$ , and we recall that  $|z|^2 = z\bar{z} = x^2 + y^2$ . As distance between two complex numbers  $z, w$ , we use  $d(z, w) = |z - w|$ , which equals the euclidean distance in  $\mathbb{R}^2$ , when  $\mathbb{C}$  is interpreted as  $\mathbb{R}^2$ . With this distance  $\mathbb{C}$  is organized as a metric space, but as already remarked,
